

API Integration Report

1. Notifications

Endpoint: GET /api/notifications

Issue: Error - Undefined method Illuminate\Database\Eloquent\Collection::latest does not exist.

Suggestion: Ensure `latest()` is called on a query builder, not a collection.

2. Shifts

Please create at least 3 test shifts (past, current, upcoming) to allow for:

- Accepting one
- Rejecting one
- Testing shift states

Checked Endpoints:

- GET /api/shifts/upcoming - Working
- Is there a GET /api/shifts/offered or /api/shifts/past? Alternatively, can filtering be done via query parameters?

Also, is GET /api/shifts/:id supported? Please confirm the expected response.

3. Patrols

Endpoint: /api/patrols/checkpoints/:id/scan

Error: Class "App\Models\PatrolCheckpoint" not found.

Suggestion: Ensure the PatrolCheckpoint model exists and is properly imported.

4. Guard Duty Status

Need an endpoint to determine whether a guard is on-duty or off-duty.

It should also return the current shift ID if on duty, to assist with location tracking and reports.

5. Documents

Upload Endpoint: POST /api/documents

Issue: 422 Unprocessable Entity - "The selected document type is invalid."

API Integration Report

Tested with .jpg and .pdf formats.

List Endpoint: GET /api/documents

Error: Call to undefined method App\Models\User::documents()

Suggestion: Ensure a documents() relationship exists on the User model.

6. Invoices

Invoice creation returned success but the invoice does not appear in the list.

Please confirm that invoice data is being persisted correctly.

7. Trainings

Should trainings be user-specific or global?

Since user ID is available from the access token, it can be implemented either way.

8. Messages

Clarification needed on how messaging should be initiated:

- Can users start conversations?
- Or must admins initiate before users can reply?

9. Leave Requests

Is there a GET equivalent of POST /api/leave-requests to retrieve existing leave requests?

10. Notification Tracking

Confirm if notifications sent to users are also tracked in the database and accessible via /api/notifications.

11. Collaboration

Happy to collaborate to align the backend API structure with the frontend requirements.

Most of the major work is complete; only minor improvements and adjustments remain for a smooth final integration.
