

CRM Enhancement Requirements

To ensure the system fully supports our operations, we've compiled the following improvements that need to be made. These will make the CRM more user-friendly, efficient, and aligned with our daily workflows.

1. Security Board (Roster)

- Rename "Security Board" to "**Roster**" for clarity and industry alignment.

2. Shift Layout & Sectioning

- Adjust the layout so shifts are **grouped/sectioned by client** within a selected date range.
- Add dividers or similar structure for easier readability.

3. Vehicle Management

- Merge the current multiple tabs into **one section** so all vehicle information can be added and managed in one place.

4. HR Section

- Add a dedicated HR area where forms, policies, and site instructions can be created and uploaded.

5. Guard Holidays & Time-Off Requests

- Introduce a section for guards to request holidays and time off.
- Include **history and status tracking** of requests for transparency.

6. Holiday Calendar & Entitlement

- Add a **yearly holiday calendar** setup for planning.
- Add a **holiday entitlement setup** to track each guard's allowance and usage.

7. Time Format

- Change the system time format to **24-hour format** for consistency and clarity.

8. Tools Section Reorganization

- Move items currently under "Tools" (invoicing, payroll, reports, holiday management, restrictions) into their **own separate sections**.

9. Invoicing

- The invoicing section should allow:
 - **Direct invoice generation for clients** without needing to access each client profile individually.
 - Easier management of invoices in one place instead of navigating through multiple sections.

10. Payroll

- Add a dedicated payroll section to:
 - **Calculate payments for guards** automatically based on shifts worked.
 - Generate payroll reports for management use.
- This will save significant manual effort and reduce errors.

11. Check Calls & Guard Tracking

- Add **reports for check call logs** and **heat mapping**.
- For each shift (ongoing or completed):
 - Display related check call details (time, status, location).
 - Provide **real-time guard tracking** options.

12. Dashboard Guard Display

- On the dashboard, guards should be displayed with **icons based on their service type** (e.g., static guard, mobile patrol, dog handler).
- This will make it easier to quickly identify the type of service each guard is providing.

13. **Notifications with Actions**

- Currently, notifications (e.g., missed check calls) only show “a check call has been missed at shift number.”
- Notifications should also display the **date, time, and shift details**.
- When a notification is clicked, it should take the user directly to that **specific shift page** so that action can be taken immediately.
