

CRM Feedback & Feature Requirements

This document outlines the issues identified in the current CRM system along with feature requests. Real-world scenarios are provided for clarity. We request that the development team **tests these scenarios in our current software** to fully understand our operational needs and ensure the required functionalities are implemented correctly.

1. Rota & Scheduling Issues

- **Shifts not saving for Monday**

- We are able to add shifts for all days except Monday.
- *Scenario:* When scheduling a weekly rota for staff, Monday shifts disappear despite saving successfully for the other days.

- **Views not coordinated**

- Shifts shown in the full rota are missing in other views.
- *Scenario:* A shift visible on the “Complete Rota” is not appearing in the “Day View,” which creates confusion.

- **Date range not working**

- Currently, we cannot select a custom date range on the complete rota.
- *Request:* Add quick options like “This Week,” “This Month,” and also a **Custom Date Range** option. There is filter button, we can use it to filter shifts up to as many days we want

2. Shift Management Problems

- **Multiple shifts per day not supported**

- When we create multiple shifts for the same day, the system overwrites existing shifts instead of adding new ones.
- *Scenario:* For a large event requiring 100 guards, we cannot create multiple shifts for the same client and site on the same day.

- **Multiple staff per shift not supported**

- When assigning more than one staff member to a shift, the system only creates one shift with one staff.
- *Scenario:* A site requiring 3 guards at the same time slot should generate 3 linked shifts.

- **Shift reassignment not working**

- The option is available but does not actually reassign staff.
- *Scenario:* If a guard calls in sick, we need to quickly reassign the shift to another available guard.

- **Scheduling restrictions not working**

- A student was scheduled for **24 hours per week** despite a restriction of **20 hours** being set.

- **Override option missing**

- While restrictions are important, admins/controllers should be able to override them.
- *Scenario:* If a guard is needed for back-to-back shifts, the system should warn us but allow us to confirm and schedule anyway.

- **Break duration setup missing**

- We need a rule for a **12-hour break between shifts**, with admin override flexibility.

3. Patrols, Check Calls & QR/NFC

- **Automatic check calls**

- These are being added but not visible when creating a shift. After creation, they can only be edited or deleted — not added.
- *Scenario*: For a high-risk site, we may need to increase check calls from every 2 hours to hourly.

- **Hourly patrols not supported**

- No option to set up hourly patrols with check calls.

- **QR/NFC integration missing**

- If a QR code is assigned to a site, it should link automatically with patrol and check calls.
- *Scenario*: When a guard scans a site QR code, the system should log the check-in and update the patrol report.

- **Option to upload QR/NFC tags per site**

- We need the ability to upload and store QR/NFC tags for each site in the CRM, so patrol data is managed centrally.

- **Heatmap reporting**

- Should be linked with hourly patrol data to visualize coverage and identify gaps.

4. Filtering, Sorting & Search Issues

- **Filters not working properly**

- The “Filter Shift” option does not function, and multiple filter options are missing.

- **Staff/Site names not sorted**

- Names are not displayed in alphabetical order by default, making it hard to locate records.

- **Search bug**

- When adding a space after the first name, some staff disappear from the results.
- *Scenario*: Searching “John [space]” does not return “John Smith.”

5. Incident Reports

- Only view and delete options are available — we cannot add or edit reports.

- *Scenario*: Site supervisors should be able to create new incident reports and update existing ones for accuracy.

6. Dispatching & Notifications

- **Multiple shifts cannot be dispatched together**

- *Scenario*: Creating 10 shifts for an event requires dispatching them one by one instead of all at once.

- **Error messages unclear**

- When dispatching, the system sometimes says “Staff already assigned elsewhere,” but does not show where.

7. Staff Management

- **Duplicate staff validation missing**

- The system should check if the same **SIA license or NI number** is being added for another staff member.

- **No option to update staff login**

- Emails and passwords cannot be updated for existing staff.
- *Scenario:* If a guard changes their email or forgets their password, admins should be able to reset/update.

8. Role-Based Access Control (RBAC)

- Currently, there is no role-based access.
- *Scenario:*
 - Controller A → Can manage scheduling only.
 - Controller B → Can manage scheduling + incident reports.
 - Admin → Full access.

9. System Performance & Usability

- **No auto-refresh**

- After creating a shift, the system does not refresh automatically.

- **Navigation issue**

- After creating a shift, the system does not take us back to the created shift screen.

Implementing these fixes and features will:

- Improve scheduling accuracy.
- Reduce operational errors.
- Support large-scale event management.
- Minimize manual work.
- Ensure compliance (e.g., student hour restrictions, SIA license validation).
